DETAILED ACTION

Drawings

1. The drawings as submitted on 25 July 2001 are acceptable.

Specification

2. The specification and abstract as submitted are acceptable.

Allowable Subject Matter

3. Claims 1-24 are allowed.
4. The following is an examiner's statement of reasons for allowance:

applicant's independent device claim 1 and independent method claim 13 recite a device and method for making such device, respectively, with a specific order of layers.

The device is constructed of the following: a mono-crystalline substrate, a layer of amorphous oxide, a layer of mono-crystalline perovskite oxide material, a mono-crystalline compound semiconductor material and an arrayed wavelength grating device.

The method for making the device is as follows: providing a mono-crystalline substrate, depositing a layer of mono-crystalline perovskite oxide material on the silicon substrate, forming an amorphous oxide layer between the perovskite layer and the silicon substrate, forming a mono-crystalline compound semiconductor layer over the perovskite oxide layer and forming an arrayed wavelength grating device over the mono-crystalline substrate.

Droopad et al. (US 2001/0013313 A1) teach a method and apparatus for growing mono-crystalline layers on a silicon wafer (paragraph 0004). Also, multiple mono-

crystalline layers can be grown on top of one another (paragraph 0005). Perovskite oxides can be layered as a buffer layer (column 0020).

Cheung et al. (6,071,795) teach a layered semiconductor device which can use a perovskite compound as a second substrate (see claims 1 and 15).

McKee et al. (5,876,866) teach a multi-layered semiconductor device structure and process for making the structure. The structure includes a perovskite oxide layer (column 1, lines 65 et seq., continuing to column 2, lines 1-3).

Baeuerle (4,63,826) teaches perovskite oxides as dielectric materials in the ceramic and single crystal form and used in electronics such as capacitors and piezo electric elements (column 1, lines 60 et seq.).

Japanese Patent (JP 01052329, to Sumitomo Electric Ind. Co.) teach an amorphous oxide layer deposited onto a metal substrate. An oxide super conducting layer containing perovskite is deposited on the amorphous oxide layer.

However, none of the above references, or any combination of the above references, specifically teach or suggest all layers or process of making those layers as recited in applicant's independent claims 1 and 13. Also, none of the references teach an arrayed wavelength grating device. Thus, all claims dependent on claims 1 and 13 are also allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
